

# REFLECTION ABOUT THE WEB PORTFOLIO

Setting up a web portfolio was both great and satisfying as it really helped me improve both by technical aspects as well as creative aspects. I was all geared toward the design aspect at the beginning choosing the right layout, color scheme, structure that was going to make the site visually appealing, but as I continued working through the project, I started focusing on user experience, accessibility and overall usability.

One of the things I learned the most was how to structure and present my work in a clear, professional manner. I had to think very hard about what projects best showcased my skills, how to make brief and descriptive descriptions of my work, and how to highlight my strengths. I also learned HTML, CSS, and probably JavaScript, or a web development tool, based on the tool I used.

Another lesson I learned is the value of planning and revision. Frequently, when I would go back and revise sections of my site to make it more functional or to fix bugs, or to rework content to be clearer I was learning that it takes time and thoughtfulness to build something worthwhile.

Finally with making a web portfolio it got me to feel really accomplished, it not only is actually a representation of my work but a reflection of me and how I've developed; most importantly it taught me how to stand out online in a way that feels both professional and personal.
